Don't Be Shocked May is Electrical Safety Month

Working with energized equipment presents unique hazards, including the threat of electrocution and severe burns from an arcing fault. For employees working with electrical components in or near “energized” environments, the need for standards, rules, and safety-related products designed to protect their health is critical.

PROPER REST IS IMPORTANT

Employees who are not well rested at home can be severely fatigued at work. A lack of alertness can lead to a range of health and safety issues that can affect both them and others. Work safety moments on rest should encourage people to ensure they're getting enough rest for workplace health and safety reasons and schedule regular breaks so they can recharge on the job.
